

Success Rates at Concept

Pregnancy rates can be affected by a number of factors including the age of the female partner and the number of embryos transferred. At Concept there is no upper age limit for access to IVF provided the female is not menopausal

and the couple have received counselling regarding their lower chance of success. Over 30% of female patients at Concept were aged over 40 years in 2015 and the median age was 36.2 years. Around 90% of embryo transfer

procedures at Concept are of a single embryo. This has reduced the number of twin pregnancies which remains consistently below 10% and for 2015 was 2%.

The graph below demonstrates Concept Fertility Centre clinical pregnancy rate for embryo transfer procedures resulting from IVF/ICSI and frozen embryo transfer (FET) cycles done in 2015. A clinical pregnancy is defined fetal heart present.
